

Report
of
Web Testing Intern

Submitted

To

School of Computer Science and Engineering

IILM University, Greater Noida, U.P.

In partial fulfilment of the requirement of degree of

B.Tech CSE

By

Roll Number of Student: 25scs1003002812

Name of Student: MUDIT SHARMA

Batch: 2025-29

1. Internship Overview

This report presents a detailed account of the internship completed by **Mr. Mudit Sharma** as a **Web Testing Intern** at **Dikshay's Finetune**. The internship was completed over a period of **30 days, from 20 July 2026 to 20 August 2026**. During this period, the primary focus was on website testing and quality assurance activities for the **Nisha Kohlani Aesthetic Website** project.

The internship provided practical exposure to the software testing lifecycle and helped bridge the gap between academic concepts and real-world website quality assurance. The work involved understanding website requirements, preparing and executing test cases, validating user interfaces, identifying and documenting defects, carrying out regression testing, and performing API testing. The experience also strengthened attention to detail, analytical thinking, debugging support, communication, and professional working practices.

2. Organization Profile

Dikshay's Finetune is the organization where the internship was undertaken. The internship certificate identifies the organization as Dikshay's Finetune Studio, located on Ajmer Road, Malpura (Tonk), Rajasthan. The organization provided the project environment and practical setting in which the intern developed hands-on experience in web testing and quality assurance.

The internship environment emphasized practical testing of a live website project, requiring systematic checking of functionality, usability, interface behavior, and application programming interfaces. This helped the intern understand how quality assurance contributes to delivering a stable and user-friendly digital product.

3. Internship Objectives

The major objectives of the internship were:

- To understand the practical workflow of website testing and quality assurance.
- To learn how to design, organize, execute, and document test cases.
- To identify functional, UI, usability, and integration-related defects.
- To gain practical exposure to regression testing and defect tracking.
- To understand the basics of API testing and API response validation.
- To support debugging by providing clear information about observed issues.
- To improve analytical thinking, attention to detail, and professional testing discipline.

4. Project Overview — Nisha Kohlani Aesthetic Website

The principal project assigned during the internship was the **Nisha Kohlani Aesthetic Website**. The website required systematic verification to ensure that its pages and interactive components behaved as expected and provided a consistent experience to users.

Testing a website of this nature requires attention to both visible and behind-the-scenes behavior. Visible areas include page layout, navigation, text, buttons, forms, images, responsiveness, and user interaction. Behind the interface, API calls and application responses also need validation so that the website functions reliably under normal usage.

5. Roles and Responsibilities

During the internship, the major responsibilities included the following:

- **Functional Testing:** Verifying that website features and workflows performed according to expected requirements.
- **UI Testing:** Checking page layouts, visual elements, controls, alignment, consistency, and user interaction.
- **Test-Case Creation and Execution:** Preparing structured test scenarios, defining expected outcomes, executing tests, and recording results.
- **Bug Identification and Reporting:** Detecting defects and communicating them with sufficient information for investigation and correction.
- **Regression Testing:** Rechecking previously working functionality after changes or fixes to ensure that new updates did not introduce additional problems.
- **API Testing:** Validating API behavior and responses as part of overall application quality assurance.
- **Debugging Support:** Assisting the development/debugging process by providing observations and reproducible information about issues.
- **Quality Assurance:** Contributing to the overall stability, reliability, usability, and consistency of the website.

6. Testing Methodology

The testing activities followed a structured approach. First, the functionality to be tested was understood and broken into individual scenarios. Test cases were then prepared with clear conditions, actions, and expected results. The scenarios were executed and the actual behavior was compared with the expected behavior. Whenever a mismatch was observed, it was treated as a potential defect and documented for further investigation.

After defects were addressed, relevant functionality was tested again. Regression testing was particularly important because changes made to one portion of a website can sometimes affect another portion. API testing was also incorporated to verify application-level communication and responses rather than relying only on what was visible in the browser.

7. Functional Testing

Functional testing was performed to verify whether the website features worked according to their intended purpose. Test scenarios focused on user actions and the expected system response. This included checking navigation flows, interactive controls, forms, links, and other functional components of the project.

A key learning from functional testing was the importance of testing not only the normal or successful path, but also incorrect, incomplete, and boundary inputs. This approach helps uncover issues that may not be visible during basic usage.

8. UI / UX Verification

UI testing concentrated on the visual and interactive aspects of the website. The objective was to ensure that elements appeared correctly and that users could interact with the interface without confusion. Attention was given to layout consistency, text presentation, buttons, forms, images, spacing, alignment, and overall visual behavior.

The internship also demonstrated that UI quality is closely connected with usability. A function may technically work while still creating a poor user experience if an element is misplaced, unclear, inconsistent, or difficult to interact with. Therefore, UI/UX verification formed an important part of overall quality assurance.

9. Test Case Creation and Execution

Test cases were used to make testing systematic and repeatable. A good test case clearly defines what needs to be tested, the conditions or input required, the steps to perform, and the expected outcome. During execution, the actual result was compared against the expected result and the outcome was recorded.

Area	Test Focus	Expected Result
Navigation	Check important links and page transitions	Correct destination opens without errors
Forms	Validate required fields and input behavior	Valid input is accepted and invalid input is handled appropriately
UI	Check alignment, visibility, and consistency	Elements are displayed correctly and consistently
Regression	Re-test affected features after fixes	Existing functionality continues to work
API	Validate requests and responses	Expected response is received with correct behavior

10. Defect Identification and Reporting

Defect identification involved observing differences between expected and actual behavior. When an issue was found, the focus was on understanding its impact and providing enough information to help reproduce and investigate it. Effective defect reporting is important because a vague report can delay resolution, whereas a clear report helps the development team understand exactly what occurred.

The internship strengthened the ability to observe small inconsistencies and communicate them clearly. This included distinguishing between a genuine functional defect, a UI issue, an expected behavior, and an issue requiring further clarification.

11. Regression Testing

Regression testing was performed to ensure that modifications and fixes did not negatively affect existing functionality. Previously tested features were rechecked after relevant changes. This process is essential in web projects because even a small code or interface modification can have unintended effects elsewhere.

12. API Testing and Validation

API testing provided exposure to the application layer behind the website interface. The purpose was to verify that API requests were handled correctly and that responses matched the expected behavior. This type of testing helps identify issues that may not be obvious from browser-level testing alone.

Through API validation, the internship provided an understanding of the relationship between a website's front-end interface and the services that support its functionality. This broadened the testing perspective from purely visual verification to application-level quality assurance.

13. Skills and Knowledge Gained

The internship contributed to the development of the following technical and professional skills:

- **Software Testing:** Practical understanding of functional, UI, regression, and API testing.
- **Test Documentation:** Experience in structuring test cases and recording outcomes.
- **Defect Tracking:** Improved ability to identify, describe, and communicate issues.
- **Analytical Thinking:** Learning to investigate why actual behavior differs from expected behavior.
- **Attention to Detail:** Recognizing small UI, functional, and consistency-related issues.
- **Debugging Support:** Understanding how testing observations can assist developers in troubleshooting.
- **Quality Assurance Mindset:** Thinking from the user's perspective while also considering technical reliability.
- **Professional Discipline:** Working systematically, documenting findings, and following a structured testing process.

14. Challenges Encountered and Learning

One of the main challenges in website testing is ensuring sufficient coverage. A website can contain many possible user paths, input combinations, screen sizes, and interactions. The internship demonstrated that effective testing requires prioritizing important functionality while still maintaining attention to less obvious scenarios.

Another important learning was that defect detection is only one part of quality assurance. A tester must also communicate the issue clearly, understand its possible impact, verify fixes, and perform regression testing. This helped develop a more complete understanding of the software development and testing cycle.

15. Professional Development

The internship provided an opportunity to work in a professional project environment and understand how quality assurance contributes to the final product. It encouraged disciplined observation, structured documentation, responsibility toward assigned tasks, and continuous learning.

The experience also improved confidence in approaching a website from multiple perspectives: as a user checking usability, as a tester checking expected behavior, and as a technical team member supporting defect investigation. These perspectives are valuable for future academic projects and professional software-testing roles.

16. Conclusion

The 30-day internship at Dikshay's Finetune was a valuable practical learning experience in web testing and quality assurance. Working on the Nisha Kohlani Aesthetic Website provided exposure to functional testing, UI/UX verification, test-case creation and execution, defect identification and reporting, regression testing, API testing, debugging support, and overall quality assurance.

The internship successfully connected theoretical knowledge with practical application. It developed a stronger understanding of systematic testing, improved attention to detail, and demonstrated the importance of quality assurance in delivering reliable and user-friendly websites. The knowledge and experience gained during this internship will serve as a useful foundation for future academic work and professional growth in software testing and web technologies.

17. Internship Details

Student	Mudit Sharma
Role	Web Testing Intern
Organization	Dikshay's Finetune
Project	Nisha Kohlani Aesthetic Website
Duration	20 July 2026 – 20 August 2026
Total Duration	30 Days
Primary Areas	Website Testing, Defect Tracking, Regression Testing, API Validation, UI/UX Verification, Debu
